

Android Backup and Restore guide for Non-Rooted Devices

By Evyatar Ben-Shitrit

<https://github.com/eviabs/Android-Backup-and-Restore-Guide>

In this guide we will also show how to backup/restore the Grindr app, and fix the "unable to refresh" error.

We will also use Grindr as an example across the guide.

Getting Started with adb

Android Debug Bridge (adb) is a versatile command-line tool that lets you communicate with a device. The adb command facilitates a variety of device actions, such as installing and debugging apps, and it provides access to a Unix shell that you can use to run a variety of commands on a device

<https://developer.android.com/studio/command-line/adb.html>

Installing and using adb:

Getting adb working on your machine.

- 1) Get adb (<https://developer.android.com/studio/command-line/adb.html>).
- 2) Enable debugging mode on your phone (<http://www.kingoapp.com/root-tutorials/how-to-enable-usb-debugging-mode-on-android.htm>).
- 3) Install Google USB Driver if you don't got them (<https://developer.android.com/studio/run/win-usb.html>)
- 4) Open cmd and navigate to the adb file location.
- 5) Run: `adb devices` and make sure that your device is listed:

- a. A successful command will look like this:

```
C:\WINDOWS\system32>adb devices
List of devices attached
HTC... device
```

or like this:

```
C:\WINDOWS\system32>adb devices
List of devices attached
* daemon not running; starting now at tcp:5037
* daemon started successfully
HTC... device
```

- b. If no devices are listed, and you are getting this message:

```
C:\WINDOWS\system32>adb devices
List of devices attached
```

run: `adb kill-server` and then again `adb devices`.

- c. If still no devices are listed, try one of the following solutions:
 - i. <https://stackoverflow.com/questions/21170392/android-device-does-not-show-up-in-adb-list>
 - ii. https://stackoverflow.com/questions/41792867/adb-device-list-is-empty?utm_medium=organic&utm_source=google_rich_ga&utm_campaign=google_rich_ga

- 6) Now adb should be working.

Backup

An ***.ab** backup contains all your personal and hidden data of your app.
It doesn't necessary contain your local storage data (which located in your sd card).
Make sure you copy by yourself the sd card content as well.

Backup using adb:

Creating an ***.ab** backup file using adb.

Single app backup:

- 1) Follow the adb guide.
- 2) Go to adb location and run `adb devices`. Make sure that the device list has your phone.
- 3) Run the following command: `adb backup -f myAndroidBackup.ab com.grindrapp.android`
 - a. `myAndroidBackup.ab` is your backup name.
 - b. `com.grindrapp.android` is your app's package name.The name can be viewed by:
<https://play.google.com/store/apps/details?id=com.csdroid.pkg>
- 4) A backup file named `myAndroidBackup.ab` is now created on your current folder.
- 5) If backup is empty or smaller than 2 kbs, try an older version of adb. One is located under the `adb fastboot files` folder (<https://android.stackexchange.com/a/123818/216569>)

Full backup (all apps):

Same as above, just use the following command: `adb backup -apk -shared -all -f fullAndroidBackup.ab`

References:

<https://forum.xda-developers.com/showthread.php?t=2011811>

<http://nelenkov.blogspot.ca/2012/06/unpacking-android-backups.html>

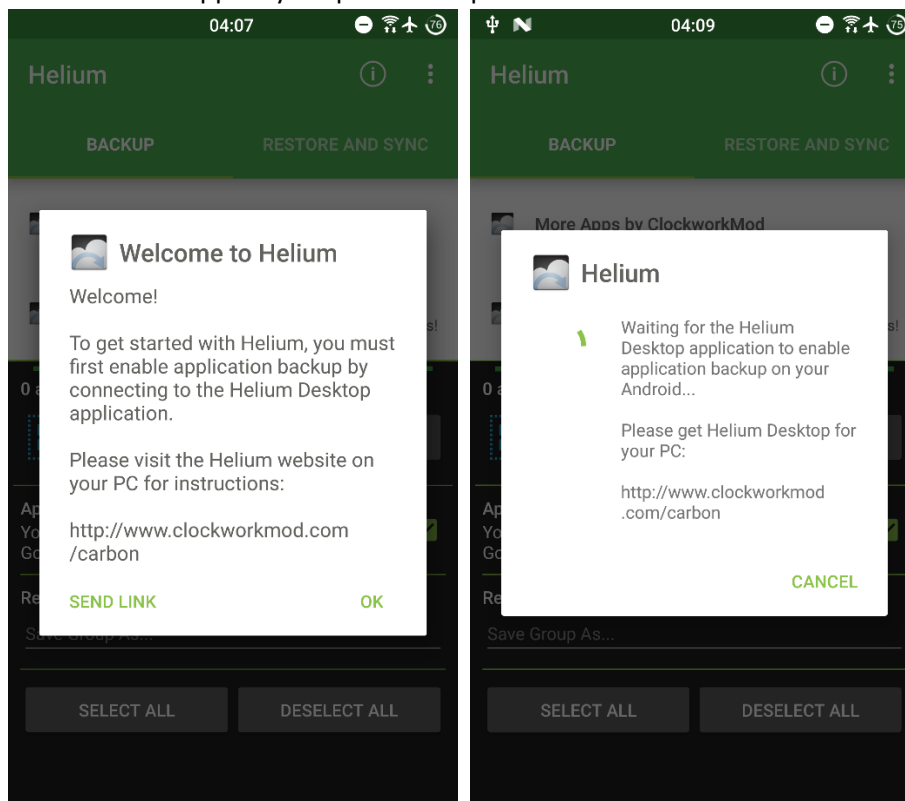

<http://stackoverflow.com/questions/15558353/how-can-one-pull-the-private-data-of-ones-own-android-app>

Backup using Helium:

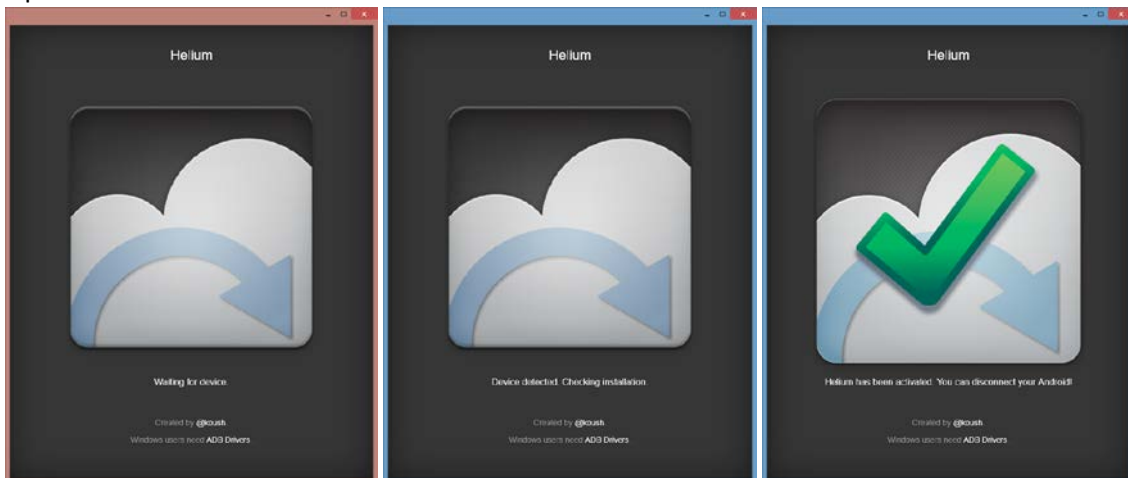

*Creating an *.ab backup file using Helium app.*

Note: it looks like Helium cannot backup properly if you use titanium's profiles with the app you want to backup. So, if you do use titanium's profiles, just use titanium to backup/restore/extract data to a new Helium backup.

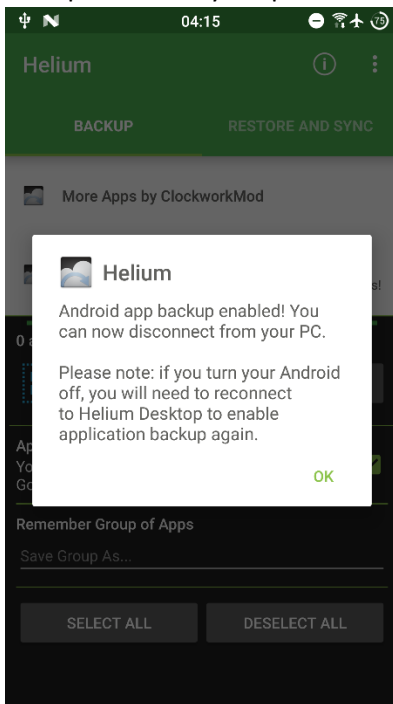

- 1) Follow the adb guide.
- 2) Install Helium on your phone
(<https://play.google.com/store/apps/details?id=com.koushikdutta.backup&hl=en>)
- 3) Install Helium on your Chrome browser (<https://chrome.google.com/webstore/detail/helium-backup/gpglbgbpeobllokpmearagpoagjbfnanl>)
- 4) Connect your phone to your computer.
- 5) Go to adb location and run `adb devices`. Make sure that the device list has your phone.
- 6) Launch Helium app on your phone and press ok:

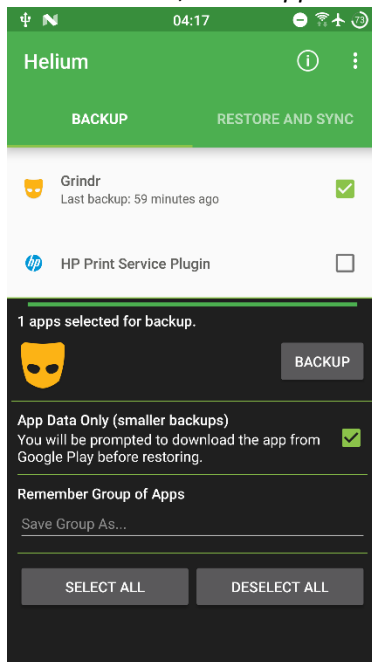

7) Open Helium extension on chrome:

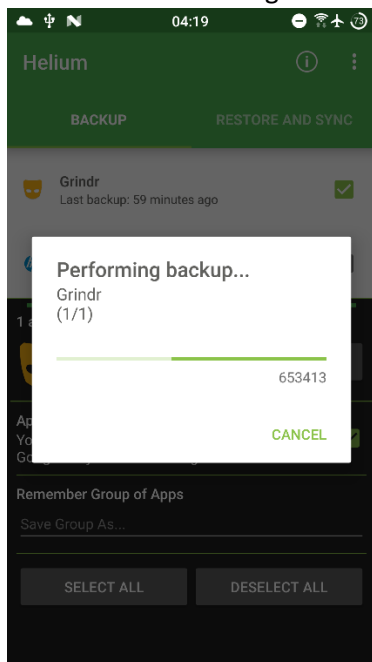

8) Now press ok on your phone:

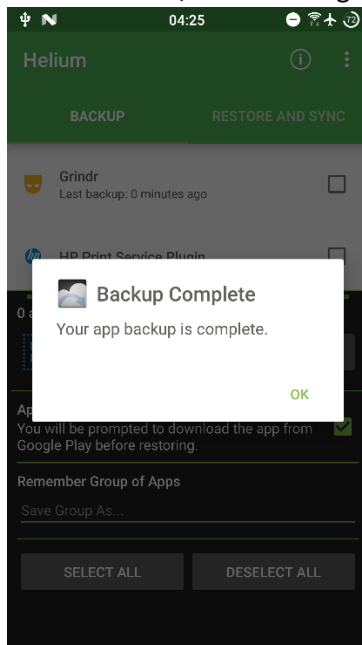

9) Choose Grindr, check *App Data Only* and press BACKUP.

10) Choose Internal Storage and wait (do not touch anything, the app will do this for you):

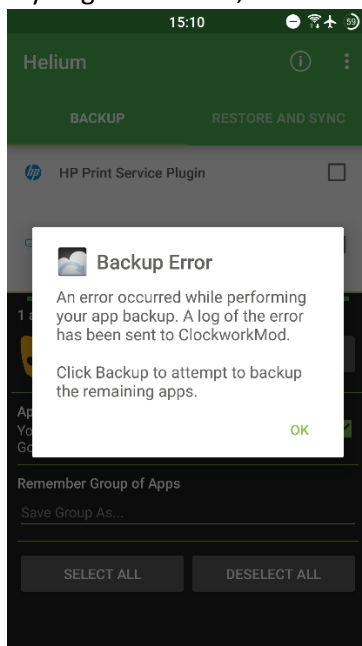

11) When finished, the following dialog will appear (click OK and exit Helium):

12) Now your *.ab backup file is in your phone: *Phone\ carbon\com.grindrapp.android*.

13) If you get this error, there are a few solutions:

check this out: <https://forums.androidcentral.com/ask-question/406201-helium-backup-app-error.html#post5752258>

- a. Clear Helium cache, clear Helium data, uninstall Helium, restart phone, reinstall Helium and try again.
- b. Plug/unplug trick.
- c. Backup as shown in *Backup using adb* section, and then try again using Helium.

Restore

Restore using adb:

Single app backup:

- 1) Follow the adb guide.
- 2) Go to adb location and run `adb devices`. Make sure that the device list has your phone.
- 3) Make sure the app is installed on your phone! Adb will not install it for you.
- 4) Run the following command: `adb restore myAndroidBackup.ab`
 - a. `myAndroidBackup.ab` is your backup name.
- 5) App is now restored.

Restore using Helium:

Follow the Backup using Helium guide, and just use the restore function 😊

Convert *.ab backup file to tar file and vice versa

In order to view a backup's content or modify it, we must convert it to an archive.
If we wish to restore our backed-up or modified data, we need to pack it as an *.ab file

helium_ab2tar method:

Convert Helium *.**ab** backup to tar and vice versa.

Reference: <https://forum.xda-developers.com/showpost.php?p=75862940&postcount=7>

You can compile the code by yourself, but I have already done this for you. Check the *compiled files* folder under *helium_ab2tar* folder. All exe files are there. If you fail to run them, you'll have to compile them by your own using this post:

Hi, the "helium_ab2tar" (https://github.com/floe/helium_ab2tar) finally helped me. Good work!

I was running Win7 and didn't have any C compiler installed, so here is what I found:

- 1) from the link above, extract helium_ab2tar-master.zip to a new directory
- 2) from <http://gnuwin32.sourceforge.net/packages/make.htm> download Binaries and Dependencies and extract files make.exe, libintl3.dll, libiconv2.dll to your helium_ab2tar-master directory
- 3) from <https://bellard.org/tcc/> download a recent TinyCC build and extract the whole zip into your helium_ab2tar-master directory
- 4) edit the makefile and change "CC=gcc" to "CC=tcc\tcc.exe"
- 5) change "-o ab2tar_cut" to "-o ab2tar_cut.exe", "-o ab2tar_corr" to "-o ab2tar_corr.exe", "-o tar2ab_cut" to "-o tar2ab_cut.exe", "-o tar2ab_corr" to "-o tar2ab_corr.exe"
- 6) finally run make.exe

How to use:

ab2tar_cut [.ab file] [temporary file]
ab2tar_corr [temporary file] [.tar file]

Or:

tar2ab_cut [.tar file] [temporary file]
tar2ab_corr [temporary file] [.ab file]

android-backup-toolkit methods:

Convert adb or Helium *.ab backup to tar.

The files are located under android-backup-toolkit folder.

Reference: <https://forum.xda-developers.com/showpost.php?p=75862940&postcount=7>

Adb backup to tar using abe:

- 1) Make sure you have got the needed software detailed in the reference.
- 2) Run the following command: `java -jar abe.jar unpack myAndroidBackup.ab myAndroidBackup.tar <password>`
 - a. `myAndroidBackup.ab` is your backup name.
 - b. `myAndroidBackup.tar` is your tar that will be created.
 - c. `password` is your backup password. Leave blank is no password set.
- 3) A new tar file is now created, which contains your data.

Adb backup to tar using dd (works on linux):

- 1) Make sure you have got the needed software detailed in the reference.
- 2) Run the following command: `dd if=myAndroidBackup.ab bs=1 skip=24 | openssl zlib -d > myAndroidBackup.tar`
 - a. `myAndroidBackup.ab` is your backup name.
 - b. `myAndroidBackup.tar` is your tar that will be created.
- 3) A new tar file is now created, which contains your data.

Helium backup to tar:

- 1) Make sure you have got the needed software detailed in the reference.
- 2) Run the following command: `java -jar hbe.jar -force/-tar com.unicell.pangoandroid`
 - a. `-force/-tar` means that either `-force` or `-tar` arguments should work. Try both.
 - b. `com.grindrapp.android` is your app's package name.
- 3) A new tar is now created, which contains your data.

Tar to ab:

- 1) Make sure you have got the needed software detailed in the reference.
- 2) Run the following command if you got android lower than 4.4.3: `java -jar abe.jar pack myAndroidBackup.tar myAndroidBackup.ab <password>`
 - a. `myAndroidBackup.ab` is your backup name.
 - b. `myAndroidBackup.tar` is your tar that will be created.
 - c. `password` is your backup password. Leave blank is no password set.
- 3) Or the following command if got higher than 4.4.3: `java -jar abe.jar pack 4.4.3+ pack-
kk myAndroidBackup.tar myAndroidBackup.ab <password>`

- a. *myAndroidBackup.ab* is your backup name.
 - b. *myAndroidBackup.tar* is your tar that will be created.
 - c. *password* is your backup password. Leave blank is no password set.
- 4) A new ***.ab** file is now created, which contains your data and ready to be restored.

Fix Grindr's "unable to refresh" error

If you don't need any of your previous data (messages, images, etc.), just uninstall the app and reinstall it. If you do want to keep your data follow this guide.

Basically, we will backup your current Grindr profile and will extract the databases out of it. Then, we will insert the databases into a new and working Grindr installation.

Fix unable to refresh error **with root** and Titanium Backup:

It is recommended to backup your app using Titanium Backup before trying this.

We assume that you are using Titanium Backup's Data Profiles. If you don't, enable "multiple profiles" for Grindr app and create 2 profiles named default and empty.

default profile will be attached to your main Grindr account.

empty profile is an empty newly created profile.

Method 1 – Using pc:

- 1) Switch to empty profile
- 2) Backup app with titanium (all profiles will be saved under the tar) and move backup to pc.
- 3) Switch to default profile
- 4) Clear the Grindr's cache of the default profile using titanium (only default cache)
- 5) Open Grindr and login to the target profile (you may change password if forgotten)
- 6) Change profile (other than target profile)
- 7) Compress the target profile's titanium folder and move it to desktop
- 8) Replace the folders "databases" and "cache" (cache is optional) in the compressed folder with the ones that you have backup-ed (you can completely delete the folders, and copy them as is from the backup)
- 9) Copy the new modified folder to the titanium's profile's folder
- 10) Open Grindr
- 11) Profit 😊

Method 2 – Without using pc:

- 1) Switch to empty profile.
- 2) Clear the Grindr's cache of the empty profile using titanium
- 3) Open Grindr and log in to your account (same account used with default profile, you may change password if forgotten)
- 4) Switch to default profile
- 5) With root explorer navigate to: /data/data/com.grindrapp.android/.data_profiles/empty
- 6) Copy all folders except: databases, cache (optional).
- 7) With root explorer navigate to: /data/data/com.grindrapp.android/
- 8) Paste the folders (override, do not merge them)
- 9) Switch to empty profile
- 10) Clear the Grindr's cache of the empty profile using titanium (so you will not be logged in with 2 profiles)
- 11) Switch to default profile
- 12) Open Grindr
- 13) Profit 😊

Note: The folder databases contains all of your messages and images. Since Grindr's folder structure is changed every now and then, you may need to copy and paste less/more files each time.

Fix unable to refresh error **without root**:

If no root is available, use this method.

Note that a root will guarantee a successful backup and restore, but, unfortunately, the non-root method will not.

- 1) Create a folder named "grindr" on your Desktop: C:\Users\User\Desktop\grindr (replace "User" with your windows user name).
- 2) Backup the target Grindr app (the app that contains your precious data, probably located on your old phone):
 - a. Create an ***.ab** backup file using Helium or adb backup (see relevant sections).
 - b. Copy the created ***.ab** file to your grindr folder.
 - c. Make sure that size of the ***.ab** is big enough (bigger than 72kb).
If the size is smaller, try both Helium and adb backup methods.
If both methods creates small files, the method **WILL NOT** work and a root is needed 😞
 - d. Name this ***.ab** file **old.ab**.
- 3) Clear Grindr's cache and data (<https://www.androidcentral.com/how-and-when-clear-app-cache-or-data-android>)
- 4) Open Grindr, log in to your account and close the app.
- 5) Repeat stage 2, and name the ***.ab** file **new.ab**.
- 6) Convert both **old.ab** and **new.ab** to tar files. Use the appropriate extractor found in android-backup-toolkit or helium_ab2tar (depends on your backup type - adb or Helium). A tar should look like this:

- 7) Copy **db** folder from the old backup and paste it (override) the **db** folder in the new backup.
Note: maybe more/less data should be copied! It's a trial and error game.
- 8) Compress (to a tar) the new modified backup and repack it to a new ***.ab**.
- 9) Restore the newly modified ***.ab** file.
